Abstract

Extensive photoelectric measurements of the δ Scuti variable 1 Mon were obtained from 1979 to 1985 at Odessa Astronomical Observatory. These data are presented and analyzed. The star shows an almost equidistant frequency triplet with a number of combinations of these three frequencies. The frequencies and amplitudes are in agreement with those found in previous years.

Introduction

The δ Scuti variable 1 Mon is of special interest because of its low projected rotational speed of 19 km/s and peak-to-peak amplitude of just under 0.3 mag. This puts the star in the intermediate region between the slowly rotating HADS (high-amplitude Delta Scuti stars) and the ocean of more rapidly rotating Delta Scuti stars with small amplitudes and mostly nonradial pulsation. The examination of these intermediate stars (e.g., 1 Mon and 44 Tau) is one of the present priorities of the Delta Scuti Network.

1 Mon is special for another reason: the star shows an almost equidistantly spaced frequency triplet. However, this triplet is composed of modes with different quantum numbers, ℓ (Balona & Stobie 1980, Balona et al. 2001). Consequently, rotational splitting of a nonradial mode as a cause for equidistance seems to be ruled out.

The variability of 1 Mon was discovered by Cousins (1963). Several subsequent short studies confirmed the variability using a single frequency with variable amplitude. Millis (1973) showed the existence of two frequencies of pulsation. It was the extensive study by Shobbrook & Stobie (1974) which revealed the existence of three frequencies as well as interactions between them.

¹formerly at Astronomical Observatory, Park Shevchenko, Odessa 270014, Ukraine

To examine the nature of the frequency triplet, lengthy studies are needed: for the 1970/71 and 1971/72 observing seasons (Millis data listed in his paper), for 1972/73 (Shobbrook & Stobie data available from the IAU Archives of Unpublished Observations of Variable Stars), for 1976/77 and 1977/78 (Balona & Stobie 1980, data on microfiche in the journal,² while the less extensive photometric data for the year 2000 are not publicly available.

During the 1978/79, 1982/83 and 1984/85 observing seasons, additional measurements of 1 Mon were obtained at the Astronomical Observatory of the Odessa State University. These were announced with very few details (Romanov & Fedotov 1979, Fedotov & Galdyr 1991). It is the purpose of the present paper to provide a brief multiperiod analysis and to make these important data available.

The observations were obtained with the photon-counting photometer and the *V* filter of the 20-cm refractor at the observational site "Mayaki" of the Astronomical Observatory of the Odessa State University. HR 2039 and HR 2198 were used as comparison stars. All measurements were transformed to the standard *UBV* system using annual transformation coefficients. Most measurements were carried out during the 1984/85 season, while some are also available from 1979 and 1982/83.

The analysis of the Odessa measurements showed that a few measurements needed to be rejected since they appear to be of very low precision or erroneous. This includes the complete night of 244 5307, for which a very large timing error of the two-hour run is suspected. Altogether, 799 measurements were used.

Analysis and pulsation behavior of 1 Mon

The photometric data presented here were analyzed for periodicities with the PERIOD04 package (Lenz & Breger 2005), which uses Fourier as well as least-squares algorithms. Data from other longer studies mentioned previously were included to provide a comparison. The previously known three main frequencies as well as a number of combination frequencies were detected. The results for the Odessa data are shown in Table 1. Note that due to zero-point uncertainties (see below) the amplitude for the mode at 0.1291 cd^{-1} needs to be treated with caution and has been put in brackets. The 13-frequency solution fits the observations with a standard deviation of ± 0.024 mag. However, these deviations are not caused by poor frequency solutions, but mainly by systematic zero-point offsets between measurements taken in different nights. Consequently, we have made an additional solution allowing for nightly zero-point corrections. Such a

²Since microfiche data may be difficult to read without special equipment, an electronic version of the data can be obtained from the first author of the present paper.

Table 1: Frequencies and amplitudes of 1 Mon from the Odessa data.

Frequency cd^{-1}	Name	V amplitude (mag)	
		Zero-point adjustments none	applied
Main modes			
7.346153	f_1	0.101	0.099
7.475269	f_2	0.065	0.065
7.217116	f_3	0.020	0.018
Other frequencies			
6.717240	f_4	0.002	0.004
14.821422	$f_1 + f_2$	0.017	0.018
14.692306	$2f_1$	0.013	0.012
14.950538	$2f_2$	0.004	0.006
14.563268	$f_1 + f_3$	0.007	0.007
22.167575	$2f_1 + f_2$	0.004	0.003
22.296691	$2f_2 + f_1$	0.003	0.003
7.604385	$2f_2 - f_1$	0.006	0.005
22.038459	$3f_1$	0.001	0.002
0.129116	$f_2 - f_1$	(0.010)	-
Residuals of fit		± 0.024	± 0.014

procedure makes the search for low frequencies impossible and we have therefore omitted the f_1-f_2 peak at 0.1291 cd^{-1} . Nevertheless, the residuals are now highly improved to ± 0.014 mag.

We detect no amplitude variability between the three observing seasons. Since 75% of the available measurements belong to a single season (1984/85), the test can only exclude large-scale amplitude variability.

Good agreement of the sizes of the amplitudes to within a few millimag is also found when we compare the present results with those published by Shobbrook & Stobie (1974) as well as Balona & Stobie (1980). This result confirms the lack of large amplitude variability in this time period. However, note that Balona et al. (2001) report a decreased amplitude of 0.012 mag for f_3 in the year 2000.

The Odessa data

The Odessa measurements of 1 Mon used in this paper are listed in Table 2.

Acknowledgments. It is a pleasure to thank Tatyana Dorokhova for helpful comments. Part of the investigation has been supported by the Austrian Fonds zur Förderung der wissenschaftlichen Forschung, project number P17441-N02.
